

US-PAT-NO: 5237614

DOCUMENT-IDENTIFIER: US 5237614 A

TITLE: Integrated network security system

----- KWIC -----

Detailed Description Text - DETX (27):

While not specifically indicated in FIG. 2, the server also stores an indication in an appropriate directory for the client, indicating that the client is unlocked, and where two or more users are authorized for a client, the user who is then authenticated for the client. Appropriate flags may also be stored at the server for the client and/or the user by a network administrator indicating resources on the network which the client and/or the user has authorization for. Thus, depending on the user's job, security level in the company and need to know, the user may be granted access to only certain files at server 12 or at server 16 or accessed to certain other clients on the network. As previously indicated, such control may be accomplished in a variety of ways known in the art, including, for example, routing all such requests through server 14, which requests are honored by the server or passed on to the appropriate other resource on the network only if the user has been properly authenticated and has authorization for such resource.
